New real-time market data source in VPD Market Data Centre

VPD Market Data Centre integrates portfolio and back office systems with market data providers, and automates the process of importing, exporting and validating both real-time data and on-demand data. Data covered is prices, index constituents, static data and corporate actions. VPD Market Data Centre is one of the best-of-breed modules in the flagship product VPD Risk & Performance.

In December 2004 VPD added a new real-time price source to the product - the real-time price service SIX Feed from the Nordic data provider SIX.

The VPD Market Data Centre collects financial data from vendors like Reuters, Bloomberg, DataStream, Lehman, MSCI, FTSE and SIX. The data is automatically quality assured in a control process, compiled and exported to your internal systems. All data is stored in an open relational database that can function as a source for e.g. front office, performance attribution and risk management applications. VPD Market Data Centre is an integrated part of our flagship product VPD Risk & Performance.

Versatile - Powerful - Distinct
